

## ASSIGNMENT 7: ERROR SIMULATION & DEBUGGING

Test AT+CMEE=2 and send unsupported commands to trigger error

The command AT+CMEE=2, which is used to enable verbose error reporting in real GSM modules, is **not supported** in the CelerSMS AT Emulator. As a result, **all errors are returned as a generic ERROR**, without specific details.

Command	Expected Verbose Error	Explanation
AT+CPIN=	+CME ERROR: invalid characters in text string	Parameter missing or formatted incorrectly.
AT+COPS=999	+CME ERROR: operation not allowed	Invalid operator ID or unsupported selection
AT+CMGF=3	+CME ERROR: invalid index	CMGF accepts only 0 (PDU) or 1 (text) modes.
